

Progression Model – Year 11 Chemistry (FoundationTier)

Module Title: Organic chemistry and chemical analysis	Module Title: The Earth's atmosphere and its resources	Module Title: Exam preparation
Learning Intent for this module: This module presents an opportunity for students to deepen their knowledge and understanding of separating mixtures and combustion reactions. Students learn about crude oil and its separation into useful products – cracking where necessary. Products of combustion are considered, both complete and incomplete, and their problems discussed. They will look at the concept of purity and mixtures in chemistry, including the use of formulations. They will also look at the use of chromatography to separate mixtures and learn how gases can be identified in the laboratory. <ul style="list-style-type: none">• Hydrocarbons• Crude oil• Fractional distillation• Properties of hydrocarbons• Combustion• Cracking• Purity and formulation• Chromatography• Identifying gases	Learning Intent for this module: In year 10, students looked at idea of acidic substances and chemical reactions. This module offers a chance to review these ideas in the context of the Earth's atmosphere. Pupils will develop their KS3 understanding of the impact of climate change and the human effect on it. They will learn about the gases in the atmosphere and link these to climate change. Students will move on to explore Earth's resources and the concept of finite and renewable resources. They will investigate the production of potable water and look at alternative methods of extracting metal from the Earth. <ul style="list-style-type: none">• History of the atmosphere• Greenhouse gases• Climate change• Global warming• Potable water• Finite resources• Life cycle assessments• Metal extraction	Learning Intent for this Module: Students are provided the opportunity to revisit and review key ideas and provide revision, consolidation and examination practise prior to examination. Revision of paper 1 and 2 topics <ul style="list-style-type: none">• Atomic structure• Bonding• Quantitative chemistry• Chemical changes• Energy changes• Rate and extent• Organic chemistry• Chemical analysis• Chemistry of the atmosphere• Using resources

<p>Key Content to be learned: Students will learn about crude oil and how it can be separated into its key constituents, hydrocarbons, by use of fractional distillation. Students will learn how each fraction contains useful products that have various uses and how small hydrocarbons can be used as fuels when burned in oxygen. They will look at how hydrocarbons can be broken down into more useful products by means of cracking. Students will then learn about the concept of purity in chemistry. Students will learn how useful mixtures are known as formulations. Students will revisit and deepen their understanding of chromatography and testing for gases.</p>	<p>Key content to be learned: In this module, students will learn about the history of the Earth's atmosphere and how it has changed over 4 billion years. Key links are made to biology as students study the effect of photosynthesis and respiration on the Earth's atmosphere. Students will move on to learning about greenhouse gases, climate change and the phenomenon of global warming. They will study the effect of human activities and how scientist evaluate data. Students will then move on to looking at Earth's resources including finite and renewable resources and the production of potable water. They will look at alternative ways to extract metals from the earth and finally, life cycle assessments.</p>	<p>Key Content to be learned: Students will retrieve and practice application of their chemistry knowledge by completing exam preparation and revision.</p>
<p>Prior knowledge:</p> <ul style="list-style-type: none"> • The concept of a pure substance and a mixture • Types of chemical bonding: ionic, covalent, and metallic • Bulk properties of materials related to bonding and intermolecular forces • Separation techniques for mixtures of substances 	<p>Prior knowledge:</p> <ul style="list-style-type: none"> • The composition of the Earth • The structure of the Earth • The rock cycle and the formation of igneous, sedimentary and metamorphic rocks • Earth as a source of limited resources and the efficacy of recycling • The carbon cycles • The composition of the atmosphere • The production of carbon dioxide by human activity and the impact on climate. • Reactions of acids with metals and alkalies 	<p>Prior knowledge:</p> <ul style="list-style-type: none"> • Atomic structure and the periodic table • Bonding and properties of matter • Quantitative chemistry • Chemical changes • Energy changes • Rate and extent of chemical change • Organic chemistry • Chemical analysis • Earth's atmosphere • Using resources
<p>Key tasks for this module:</p> <ul style="list-style-type: none"> • Mock exam • Organic chemistry and analysis 	<p>Key tasks for this module:</p> <ul style="list-style-type: none"> • Chemistry of the Atmosphere • Mock exam 	<p>Key tasks for this module:</p> <ul style="list-style-type: none"> • Past Papers • GCSE Exams
